( a ) Plot of exposed Ni and Al nanoparticle surface area as a function of distance between nanoparticle centers and ( b ) a plot of total exposed surface area as a function of distance between nanoparticle centers. These results assume a Ni nanoparticle of radius 4.53 nm and an Al nanoparticle of 5.23 nm. Notice that the total exposed surface area is monotonically decreasing, indicating that the surface energy is also decreasing monotonically In figure 2, 2a is the diameter of a circle circumscribed by the contact circumference of the two nanoparticles. v and v are the distance from the Al and Ni nanoparticle surface to the surface Al Ni of the contact circle, respectively. is the contact angle as measured from the center of the Ni nanoparticle and ranges from 0 to radians. In order to model the change in energy of the coalescing nanoparticle system, three energy change mechanisms must be considered. These mechanisms are energy release due to change in surface area, energy release due to kinetic reactions at the...
