## Correlation between Structural and Electronic Properties of Co-Evaporated Doped Organic Thin Films

By Daniela Donhauser

Cuvillier Verlag Okt 2014, 2014. Buch. Book Condition: Neu. 211x146x4 mm. Neuware - Devices based on organic semiconductors, like organic light emitting diodes (OLEDs) or organic solar cells, often comprise electrochemically doped charge transport layers, which improve the performance of these devices. Although very efficient devices can be realized nowadays, a comprehensive description of the physical processes taking place in electrochemically doped thin films is still missing. For instance, it was shown for a variety of different material systems that the doping efficiency, defined as the number of free charge carriers compared to the number of incorporated dopants, often amounts to only a few per cent. The organic semiconductor CBP (4,4'-Bis(N-carbazolyl)-1,1'-biphenyl), doped with the transition metal oxide molybdenum oxide (MoO<sub>3</sub>), is used here as a model system to investigate the origin for this low doping efficiency. Results from different measurement techniques, like electron tomography, EF-TEM, PES, FTIR-spectroscopy and (temperature- dependent) electrical measurements were correlated to get insight into the origin of the low doping efficiencies and to obtain a model to describe charge transport in MoO<sub>3</sub>-doped CBP films as a function of the doping concentration. 166 pp. Englisch.

### Reviews

*If you need adding benefit, a must buy book. This really is for all who stante that there had not been a well worth reading. It is extremely difficult to leave it before concluding, once you begin to read the book.*

-- **Claud Bernhard**

*It is an remarkable pdf which i have ever go through. Of course, it can be play, nonetheless an interesting and amazing literature. I realized this pdf from my dad and i suggested this book to discover.*
